3. Regarding Claims 2,4, and 10, Ozue et al shows (Fig. 7), a magnetic head (6) which is mounted on a rotary drum capable of allowing a tape magnetic recording medium to run thereon and moves with the rotation of the rotary drum (1), so as to perform recording on the tape magnetic recording medium (7) or reproducing from the tape magnetic recording medium, the magnetic head comprising a surface for facing the tape magnetic recording medium and for performing hydrodynamic interference (inherent – air bearing surface of rotary drum created due to the spin) with the tape magnetic recording medium while moving by the rotation, a

recording/reproducing portion (64) for producing magnetic interference with the tape magnetic recording medium in a non-contact state, wherein the surface is a smooth flat surface placed within a cylindrical drum surface [0032], wherein a head gap is placed in a range where a magnetic tape is close to a minimum distance (t1) capable of producing mutual magnetic recording and reproducing, and the recording/reproducing portion is placed outside an area where the tape magnetic recording medium contacts the surface by the hydrodynamic interference and is provided so as to be able to perform at least either recording or reproducing by the magnetic interference with the tape magnetic recording medium in a non-contact state (tape is above surfaces 64 a,b,c) , wherein the surface facing to the tape magnetic recording medium is a smooth curved surface having a curvature gentler than the curvature of the rotary drum.
